

CONTENT MANAGER INTEGRATION

Abstract of the Disclosure

A system for managing electronic content on a computer network comprises an electronic content library. The electronic content library is configured to store a plurality of files, and to maintain revision history data for the files stored therein. The system further comprises a web content manager configured to publish one or more of the files stored in the electronic content library on a webpage. The system further comprises a content manager. The content manager is configured to check-out a selected file from the electronic content library upon a user's request, and to check-in an updated version of the selected file to the electronic content library. Checking-in the updated version of the selected file causes the revision history data in the electronic content library to be updated. The system further comprises an event trigger subsystem configured to notify the web content manager of the updated version of the selected file based on the revision history data.
